Do Now

Write each of the following in vertex form and identify the turning point. You will need to COMPLETE THE SQUARE!

(a)  $x^2 + 14x - 38$

$$x^2 + 14x + 49 - 49 - 38$$

$$\frac{14}{2} = (7)^2 \quad y = (x+7)^2 - 87$$

$$-49$$

$$y = (x+7)^2 - 87$$

$(-7, -87)$

(b)  $x^2 - 12x + 11$

$$x^2 - 12x + 11$$

$$6^2 = 36$$

$$x^2 - 12x + 36$$

$$-36 + 11$$

$$y = (x-6)^2 - 25$$

$(6, -25)$

**THE ZEROES OF A QUADRATIC**

The  $x$ -locations on any function where the output (the  $y$ -coordinate) is equal to zero are known, not surprisingly, as the **zeroes of the function**. These are amazingly important in applied settings. When they are **rational numbers** then they can be found using a factoring technique. We'll develop the idea in the first exercise.

**Exercise #1:** Consider the quadratic function  $y = x^2 - 2x - 3$ . It's graph is shown below.

$x$ -intercepts

(a) What are the zeroes of the function? Write their  $x$ -values and circle them on the graph.

$x = -1$        $x = 3$

(b) Factor the expression  $x^2 - 2x - 3$ . How do these factors compare to the zeroes?  $y$ -value

$-1$  and  $3$  ✓  
 $-3$  and  $1$  ✓

$x^2 - 2x - 3$   
 $x^2 - 2x - 3$   
 $(x - 3)(x + 1) = 0$

(c) Based on (b), determine where the zeroes of  $y = x^2 + 3x - 10$  are algebraically. Verify using a table.

$$\begin{array}{r|l} x - 3 = 0 & x + 1 = 0 \\ +3 & -1 \\ \hline x = 3 & x = -1 \end{array}$$

What is really going on here is perhaps the **second most important equation solving technique**, known as the **Zero Product Law**.

**THE ZERO PRODUCT LAW**

If two or more quantities have a product of **zero** then at least one of them must be equal to **zero**. In symbolic form:

If  $a \cdot b = 0$  then either  $a = 0$  or  $b = 0$  (or both are zero)

**Exercise #2:** Use the Zero Product Law to find all solutions to each of the following equations.

(a)  $(x + 7)(x - 2) = 0$

$$\begin{array}{r|l} x + 7 = 0 & x - 2 = 0 \\ -7 & +2 \\ \hline x = -7 & x = 2 \end{array}$$

(b)  $(2x - 1)(3x + 4) = 0$

$$\begin{array}{r|l} 2x - 1 = 0 & 3x + 4 = 0 \\ +1 & -4 \\ \hline 2x = \frac{1}{2} & 3x = -\frac{4}{3} \\ \frac{2x}{2} = \frac{1}{2} & \frac{3x}{3} = -\frac{4}{3} \\ x = \frac{1}{2} & x = -\frac{4}{3} \end{array}$$

The **Zero Product Law** is remarkable because it allows us to solve equations with an  $x^2$  or higher level term in it, as long as the expression set equal to zero can be **factored**.

**Exercise #3:** Find the **roots** (solutions) to each of the following equations by using the **Zero Product Law**. Sometimes you will be instructed to **solve by factoring**.

(a)  $x^2 + 4x - 12 = 0$

$(x-2)(x+6) = 0$   
 $x-2 = 0$     $x+6 = 0$   
 $x = 2$     $x = -6$   
 (-6, 0)

(b)  $2x^2 - 14x = 0$

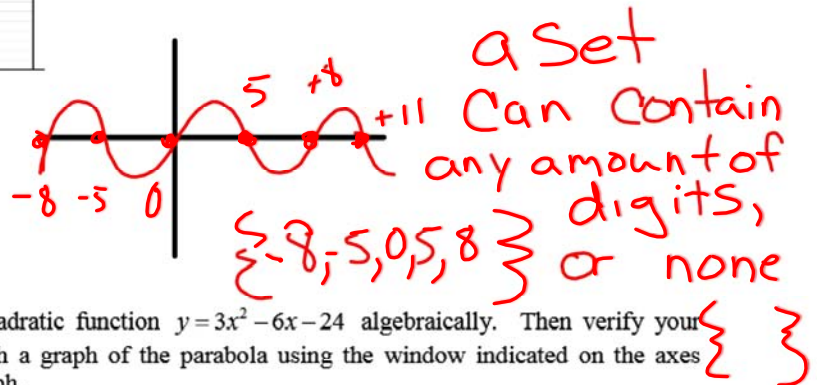

$2x(x-7) = 0$   
 $2x = 0$     $x-7 = 0$   
 $x = 0$     $x = 7$

(c)  $x^2 - 25 = 0$

$(x-5)(x+5) = 0$   
 $x-5 = 0$     $x+5 = 0$   
 $x = 5$     $x = -5$   
 $\{5, -5\}$

X	Y1
-12	-12
-11	-11
-10	-10
-9	-9
-8	-8
-7	-7
-6	-6
-5	-5
-4	-4
-3	-3
-2	-2
-1	-1
0	0
1	1
2	2
3	3
4	4
5	5
6	6
7	7
8	8
9	9
10	10
11	11
12	12

(d)  $2x^2 + 5x - 12 = 0$

**Exercise #4:** Find the zeroes of the quadratic function  $y = 3x^2 - 6x - 24$  algebraically. Then verify your answer by using your calculator to sketch a graph of the parabola using the window indicated on the axes below. Clearly mark the zeroes on the graph.

**THE ZEROS OF A QUADRATIC  
HOMEWORK**1. The roots of  $x^2 - 6x - 16 = 0$  can be found by factoring as

(1)  $\{-16, 6\}$

(3)  $\{-2, 8\}$

$x = -16 \quad x = 6$

$x = -2 \quad x = 8$

(2)  $\{-8, 2\}$

(4)  $\{6, 16\}$

2. The equation  $(2x - 3)(x + 7) = 0$  has a solution set of

(1)  $\{-7, 1\frac{1}{2}\}$

(3)  $\{-7, 3\}$

(2)  $\{3, 7\}$

(4)  $\{\frac{1}{2}, -3\}$

3. Find the roots of each of the following equations by factoring:

(a)  $x^2 - 36 = 0$

(b)  $x^2 + 12x + 27 = 0$

(c)  $3x^2 + 5x - 2 = 0$

(d)  $20x^2 - 10x = 0$

(e)  $10x^2 + x - 21 = 0$

(f)  $4x^2 - 16x - 84 = 0$
